EV Battery Health Dashboard

How to get it running

These steps are for Windows. You open two windows that stay running, one for the backend and one for the add-in. The backend on its own already shows a working dashboard, so if you only want to see it running, the first part is all you need. You will need Python installed for the backend and Node.js installed for the add-in.

The folder paths below assume the project sits in your Downloads folder. Replace <your-username> with your Windows username, and if you saved the project somewhere else, use that location instead. The quickest way to get the right path is to open the folder in File Explorer and copy it from the address bar.

Part 1: Start the backend

1. Click the Start menu, type cmd, and press Enter to open Command Prompt.

2. Go to the backend folder by typing this and pressing Enter:

```
cd C:\Users\<your-username>\Downloads\EV-Battery-Health\EV-Battery-Health\backend
```

3. The first time only, install the Python packages. Type this, press Enter, and wait for it to finish:

```
pip install -r requirements.txt
```

4. Start the backend by typing this and pressing Enter:

```
python app.py
```

If it says python is not recognised, type py app.py instead.

5. Wait until it prints that it is running. It will say an address like http://127.0.0.1:5000. Leave this window open and running. Do not close it, the dashboard needs it.

See the dashboard now

If all you want is to see the dashboard, open your browser and go to the address below. This is the full dashboard running on the real data and you do not need the add-in for it.

```
http://127.0.0.1:5000
```

Part 2: Start the add-in (the MyGeotab version)

Do this only if you want the React and Geotab Zenith version. Keep the backend window from Part 1 running while you do this.

1. Open a second Command Prompt window, a new one, leaving the first running. Start menu, type cmd, Enter.

2. Go to the add-in folder by typing this and pressing Enter:

cd C:\Users\<your-username>\Downloads\EV-Battery-Health\EV-Battery-Health\addin

3. The first time only, install its packages. Type this, press Enter, and wait a few minutes:

npm install

4. Start the add-in. Note the command is npm run dev, not npm start:

npm run dev

5. When it finishes starting it prints a local address in the window. Open whatever address it shows in your browser. That is the add-in.

Stopping it

When you are finished, click into each Command Prompt window and press Ctrl and C to stop it, then close the windows.

If something goes wrong

If the dashboard page opens but shows no data or an error, the backend window has usually stopped, so check the Part 1 window is still running on port 5000. If npm is not recognised in Part 2, Node.js is not installed on that machine, so install it from nodejs.org, then close and reopen Command Prompt and try again.
